Vol. XLV, No. 67

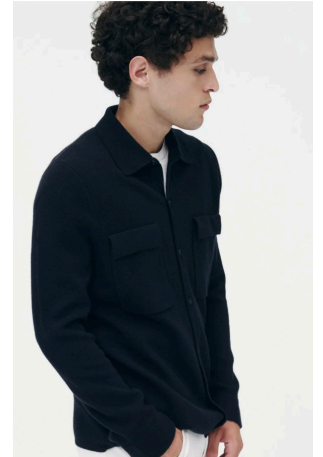

TREND REPORT!!!

Griffin Conley,
owns a boat

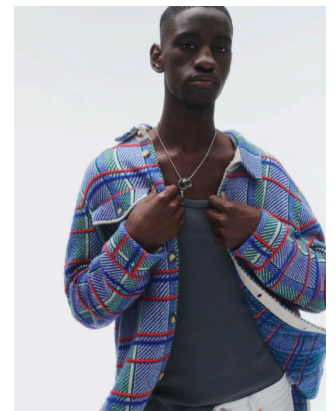

Guys. I'm giving you good advice and you need to trust me. Cashmere shackets are on the horizon and right now is the peak time to buy one. Hear me out!!!!

If you buy one soon you'll maximize your coziness for peak cold times of 2025. Think about it, it's only going to get colder on campus. And then you'll have it for autumns and winters to come. Plus Winter Break is looming. You need to prepare yourself for weird run-ins with people from high school or annoying family members. Cashmere is the only protection you can guarantee. Get on it!!!

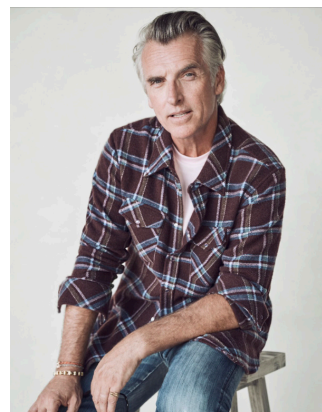

The most basic one I've found is from Nadaam. While it only comes in solid taupe and navy, it's that perfect medium of trying but not putting effort in. Perfect for getting some "oh you look so handsome" from aunts and grandmas.

Guest in Residence takes it a step further by offering their shakets in two options. On the left we have their tweedy approach. If you look closely you'll notice a speckled pattern. Unsure if it's a textured 3-d knit (if someone gifts it to me, I will do a follow up review). On the right we see a fun multicolored option. I like that they scream plaid, but not in an "omg I swear I saw that in a LL Bean catalog". Both styles come in multiple colors. Everyone say "thank you, Gigi"!

God's True Cashmere. If you can stomach giving Brad Pitt two grand, these shakets will be your new best friend. GTC offers the most traditional tartan offerings. If one of your biggest fears with a 100% cashmere shacket is standing out too much, these are the shakets you need. A fun note about these shakets is they are all made with gemstone snaps such as moonstones and rose quartz. Where else can you get crystals with your shakets?

POLYESTER: A RESPONSE TO CASH-MERE

Selah and Micah,
Urban Outfitters lovers

As we approach the coldest, greyest part of the year, it can be hard to figure out just what type of fabrics will protect you from the harsh, brutal conditions. If you're only from one coast, you probably aren't well-versed in dressing for the weather, and you just may find yourself baffled as the sweltering Ohio humidity transforms into a crisp, bone-chilling breeze. Having received terrible advice about a little thing called cashmere, you may even be wondering, Is it even possible to be both warm and stylish in the winter? But fear not. We have a solution: polyester.

Polyester, with its high tensile strength and abrasion resistance, has all of your clothing needs covered!

Pros of polyester:

1. Can be put in the washer and dryer at HIGH HEAT
2. Feels like athleisure, looks like... Nordstrom Rack?
3. It can handle daily wear and tear like a champ!
4. It's low maintenance and cheap— every frat boy's dream.
5. Moisture resistant - great to wear in the rain!
6. Petroleum based - moisturizing!
7. Affordable - ten polyester going out tops = one cashmere going out top
8. Princess Anne sometimes wears polyester, according to someone on Quora.
9. A polyester sweatshirt will keep you fully covered. No sun damage for this guy!
10. Bleds well with other synthetic fibers - friends with all the other fabrics!

Cons of polyester: None :P

(Disclaimer: "Polyester is not eco-friendly, as it's a petroleum-based product, which means it's not sustainable and takes hundreds of years to break down. In addition, the microfibers in polyester clothing often end up in our waterways where they're ingested by fish, other marine life, and humans as well. The first issue polyester can't get around is that the material is made from petroleum and fossil fuels. Demand for polyester contributes to hundreds of millions of barrels of oil being extracted and refined from the earth. Additionally, clothing brands find it difficult to transparently understand the source of their polyester - the practices or locations of where the oil came from are difficult to know or share with the consumer. While polyester is a relatively cheap material to manufacture, creating it still requires a lot of energy to be used. Additionally, toxic chemicals and heavy metals used in the manufacturing process can find their way into wastewater and ultimately the surrounding environment." (Sports Casual International))
